

Ideation Phase

Empathy Map Canvas

Date	01 October 2026
Team ID	SWTID-2026-4057
Project Name	Implement Client Script & UI Policy (Incident)

User / Customer

Primary user: ServiceNow Incident user who creates, updates, and manages Incident records. The empathy map focuses on the user's experience with Incident data entry, conditional field behavior, validation, and controlled updates.

SAYS	THINKS
"I need the Incident form to guide me and prevent incorrect data entry." "I want required information to be clear before I save." "I should know why an action is blocked."	"The form should apply the correct rules automatically." "I should not have to remember every field rule manually." "High Impact Incidents need stricter control."
DOES	FEELS
Creates and updates Incident records. Changes Impact and other Incident fields. Attempts to save records. May interact with Incident records through the list.	More confident when required information is enforced. Less concerned when the form gives immediate guidance. Concerned about incorrect or incomplete Incident data when controls are absent.

PAINS / PROBLEMS

Pain Point	Project Context
Incomplete Incident information	Important information may not be supplied consistently without conditional controls.
Manual dependency	Users may need to remember which fields and values are required under specific Incident conditions.
Incorrect submission	A High Impact Incident should not be saved when Assigned To is empty.
Uncontrolled list interaction	Direct State changes through list editing should be restricted according to the project rules.

NEEDS / GAINS

Need / Gain	Expected User Benefit
Conditional field control	Assignment group becomes mandatory when Impact is High.
Controlled Urgency behavior	Urgency is controlled for High Impact and can be set automatically when Impact changes.
Save validation	Invalid High Impact submissions are prevented with clear feedback.
Controlled updates	Users are guided toward the appropriate Incident form interaction instead of unsupported list edits.

EMPATHY MAP INSIGHT

The Incident user needs a form that actively guides data entry rather than relying entirely on manual knowledge of rules. UI Policies and Client Scripts address this need by providing conditional field control, automatic behavior, validation, and controlled interaction at the point where the user works with the Incident.
