

Problem–Solution Fit

Implement Client Script & UI Policy (Incident)

Date	01 October 2026	Team ID	SWTID-2026-4057
Project Name	Implement Client Script & UI Policy (Incident)	Platform	ServiceNow Incident

1. Problem Definition

Incident records require consistent and accurate data entry for effective triage, routing, and resolution. Manual checking can result in incomplete, inconsistent, or incorrect information being submitted. The project addresses this by applying conditional field behavior and validation directly on the ServiceNow Incident interface.

2. Proposed Solution

The solution combines a ServiceNow UI Policy, UI Policy Actions, and three Client Scripts. Together they dynamically control fields based on Incident conditions, automatically update Urgency, validate required information before saving, and prevent direct State changes through list editing.

3. Problem–Solution Fit Matrix

Problem / User Need	Project Solution	How the Fit Is Achieved
High Impact Incidents need complete routing information.	High Impact Control UI Policy makes Assignment group mandatory.	When Impact = 1 – High, the policy enforces the mandatory requirement immediately on the Incident form.
Urgency should be controlled for High Impact Incidents.	UI Policy Action makes Urgency read-only.	The Urgency field remains visible but cannot be manually changed while the High Impact condition is active.
Related field values should be updated consistently when Impact changes.	onChange Client Script automatically sets Urgency to High.	Changing Impact to High triggers the script and updates Urgency without requiring form submission.
Incomplete High Impact Incidents should not be saved.	onSubmit Client Script validates Assigned To.	If Impact is High and Assigned To is empty, submission is stopped and an error message is displayed.
State should not be changed directly through Incident list editing.	onCellEdit Client Script blocks State list edits.	The callback returns false and a message instructs the user to open the Incident instead.
Rules should be reversible when the High Impact condition no longer applies.	UI Policy uses Reverse if false.	When Impact changes away from High, policy-controlled field behavior is reverted.

4. Fit by User Interaction

User Situation	Expected System Behavior	Fit
User selects Impact = High	Assignment group becomes mandatory; Urgency becomes read-only; Urgency is set to High by the onChange script.	Directly addresses conditional field control.
User attempts to save without Assigned To	onSubmit validation blocks the save and shows an error.	Directly addresses incomplete submission.
User edits State from the Incident list	onCellEdit blocks the change and displays guidance.	Directly addresses restricted list interaction.
User changes Impact away from High	Reverse if false restores the policy-controlled field behavior.	Supports normal editing when the condition is no longer active.

5. Alignment with Project Objective

The project objective is to demonstrate how ServiceNow client-side controls can enforce data integrity on Incident records. The implemented solution fits this objective because each major problem is mapped to a specific native ServiceNow control: UI Policy for conditional form behavior, UI Policy Action for field-level restrictions, onChange for automatic updates, onSubmit for save validation, and onCellEdit for list interaction control.

6. Value Delivered

The solution provides immediate guidance and enforcement at the point where users interact with Incident data. It reduces reliance on manual checks, helps maintain required information for High Impact Incidents, and keeps restricted interactions under controlled rules while allowing valid updates to proceed.

7. Problem–Solution Fit Conclusion

The implemented ServiceNow configuration provides a direct fit to the identified Incident data-entry and field-control problems. Each identified need is addressed by a corresponding UI Policy, UI Policy Action, or Client Script behavior, creating a consistent and testable connection between the problem definition and the implemented solution.
