

PROJECT DESIGN PHASE

Proposed Solution

Date	01 October 2026
Team ID	SWTID-2026-4057
Project Name	Implement Client Script & UI Policy (Incident)

1. Solution Overview

The proposed solution is to configure ServiceNow Incident form and list behavior using UI Policies and Client Scripts. The solution dynamically controls fields based on incident conditions and user actions, provides immediate validation feedback, and prevents incomplete or inappropriate updates without requiring the form to be submitted for every rule evaluation.

2. Proposed Solution Components

Component	Implementation	Purpose
UI Policy – High Impact Control	Condition: Impact is 1 - High; Reverse if false enabled; On load enabled.	Applies high-impact field controls dynamically.
UI Policy Action – Assignment group	Assignment group is made mandatory when the policy condition is true.	Ensures routing information is provided for High Impact incidents.
UI Policy Action – Urgency	Urgency is made read-only while Impact is 1 - High.	Prevents inappropriate manual changes to the urgency value.
onChange Client Script	When Impact changes to 1 - High, Urgency is set to 1 - High and an information message is shown.	Keeps urgency consistent with the selected impact.
onSubmit Client Script	When Impact is 1 - High and Assigned To is empty, display an error and return false.	Prevents incomplete High Impact incidents from being saved.
onCellEdit Client Script	Blocks direct State changes through list editing and asks the user to open the Incident.	Controls State updates through the Incident form.

3. Working Flow

1. The user opens or creates an Incident record.
2. The user enters incident information and selects the Impact value.
3. If Impact is set to 1 - High, the High Impact Control UI Policy becomes active.
4. Assignment group becomes mandatory and Urgency becomes read-only.
5. The onChange Client Script automatically sets Urgency to 1 - High and displays an information message.
6. During save, the onSubmit Client Script checks whether Assigned To is populated. If it is empty, the save is blocked and an error is shown.
7. If the user attempts to change State directly from the Incident list, the onCellEdit Client Script blocks the change and instructs the user to open the Incident.
8. If Impact is changed from High to another value, Reverse if false restores the normal field behavior.

4. Solution–Requirement Mapping

Requirement / Need	Proposed Solution
Control fields for High Impact incidents	High Impact Control UI Policy
Require Assignment group	UI Policy Action makes Assignment group mandatory
Prevent manual Urgency modification under High Impact	UI Policy Action makes Urgency read-only
Automatically align Urgency with High Impact	onChange Client Script sets Urgency to High
Prevent incomplete High Impact submissions	onSubmit Client Script validates Assigned To
Prevent State changes through list editing	onCellEdit Client Script blocks direct list edits
Restore normal behavior when condition is false	UI Policy uses Reverse if false

5. User Interaction and Feedback

The solution provides immediate interface-level feedback. Mandatory-field behavior is applied dynamically, the Urgency value is automatically controlled for High Impact incidents, save validation identifies a missing Assigned To value, and list editing of State is explicitly blocked. These controls guide the user at the point of interaction rather than relying only on post-submission correction.

6. Expected Outcome

The proposed solution provides controlled and consistent Incident form behavior. High Impact incidents receive the required field controls, important values are kept consistent, incomplete records are prevented from being saved, and State changes through direct list editing are restricted. The configuration remains within the ServiceNow Incident interface and uses the implemented UI Policy and Client Script mechanisms.

7. Conclusion

The proposed solution directly addresses the identified Incident data-entry and field-control problems through targeted ServiceNow UI Policies and Client Scripts. It improves guided data entry and validation while preserving normal Incident behavior when the High Impact condition is not active.
