

REQUIREMENT ANALYSIS

Solution Requirements

Date: 01 October 2026 | Team ID: SWTID-2026-4057 | Project Name: Implement Client Script & UI Policy (Incident)

Problem Description

This project focuses on implementing Client Scripts and UI Policies on the ServiceNow Incident form to improve user experience, enforce field behavior, and reduce incorrect data entry. The implementation dynamically controls form fields based on user actions and incident conditions without requiring the form to be submitted.

Solution Objective

The solution shall provide conditional field control, automatic field behavior, save-time validation, and controlled list interaction on the ServiceNow Incident table. The controls shall operate at the client interface so that users receive immediate guidance while creating or updating Incident records.

Functional Requirements

ID	Requirement	Expected System Behavior	Implementation
FR-01	High Impact UI Policy	When Impact is 1 – High, the High Impact Control UI Policy shall become active.	UI Policy on Incident table; condition: Impact is 1 – High.
FR-02	Assignment group mandatory	Assignment group shall become mandatory when the High Impact condition is true.	UI Policy Action / mandatory field behavior.
FR-03	Urgency read-only	Urgency shall become read-only while the High Impact condition is active.	UI Policy Action for Urgency; Read-only = true.
FR-04	Reverse policy behavior	When the High Impact condition becomes false, policy-applied field changes shall be reversed.	UI Policy: Reverse if false = true.
FR-05	Automatic Urgency update	When Impact changes to High, Urgency shall be set to High automatically.	onChange Client Script on Impact.
FR-06	Save validation	A High Impact Incident shall not be saved when Assigned To is empty.	onSubmit Client Script with validation message.
FR-07	List State restriction	Direct State changes through Incident list editing shall be prevented according to the project rule.	onCellEdit Client Script with user guidance.
FR-08	Immediate feedback	The user shall receive clear feedback when an action is prevented or required information is missing.	Client-side validation and messages.

Non-Functional / Quality Requirements

ID	Requirement Area	Project Requirement
NFR-01	Usability	Controls should guide the Incident user directly on the form and provide understandable feedback.
NFR-02	Consistency	The same defined field rules should be applied whenever the corresponding Incident condition is met.
NFR-03	Responsiveness	Client-side controls should respond to field changes and user actions without requiring form submission.
NFR-04	Data Integrity	The configuration should reduce incomplete or incorrect Incident updates by enforcing the defined rules.
NFR-05	Maintainability	UI Policies, UI Policy Actions, and Client Scripts should remain separately identifiable according to their purpose.

ID	Requirement Area	Project Requirement
NFR-06	Controlled Interaction	Restricted list interactions should provide guidance instead of allowing the unsupported State update.

Configuration Requirements

Configuration Item	Required Value / Rule	Purpose
UI Policy	High Impact Control	Controls Incident fields when Impact is 1 – High.
Table	Incident [incident]	Limits the configuration to Incident records.
Condition	Impact is 1 – High	Activates the high-impact controls.
UI Policy Action	Assignment group → Mandatory	Ensures assignment information is provided for High Impact.
UI Policy Action	Urgency → Read-only	Prevents manual modification while High Impact is active.
onChange Client Script	Impact changes to High → Urgency = High	Automates Urgency behavior.
onSubmit Client Script	High Impact + Assigned To empty → prevent save	Validates required assignment information before submission.
onCellEdit Client Script	Prevent direct State changes from list editing	Restricts unsupported list interaction.

Requirement-to-Problem Alignment

Problem / Need	Required Control	Expected Outcome
High-impact Incidents require additional field controls.	High Impact Control UI Policy + Assignment group mandatory.	Conditional control is applied when Impact is High.
Urgency should follow the defined high-impact behavior.	Urgency read-only UI Policy Action + onChange Client Script.	Urgency is automatically controlled when Impact changes to High.
Incomplete High Impact records should not be submitted.	onSubmit Client Script.	Save is prevented when Assigned To is missing.
State should not be changed directly through list editing.	onCellEdit Client Script.	Unsupported direct State changes are blocked with guidance.

Acceptance Conditions

1. The High Impact Control UI Policy activates when Impact is 1 – High.
2. Assignment group becomes mandatory under the High Impact condition.
3. Urgency becomes read-only under the High Impact condition and is automatically set to High when Impact changes to High.
4. A High Impact Incident with an empty Assigned To value cannot be submitted through the form.
5. Direct State changes through Incident list editing are prevented according to the configured onCellEdit rule.
6. When a controlled condition is no longer true, the UI Policy reverses its applied field behavior where configured.

Requirement Summary: The completed solution combines UI Policy, UI Policy Actions, and Client Scripts to provide conditional control, automatic field behavior, validation, and controlled Incident interaction.
